

Feature Comparison

Nomad Home by JLA + FUZE vs. Category-Standard Antimicrobial Treatments

Most antimicrobial home and bath goods on the market rely on first-generation silver-based chemistries that leach into wash water, carry incomplete regulatory registrations, and offer no batch-level verification. The table below maps where Nomad Home + FUZE differs.

Feature	Nomad Home + FUZE	Standard Silver-Treated	Standard Untreated
Active ingredient	FUZE metamaterial (bonded, non-leaching)	Silver chloride / silver ion / silver-zeolite (ion-releasing)	None
Mode of action	Contact mechanism on the treated surface No release into air, water, or skin	Releases silver ions into surrounding moisture	N/A
US EPA Federal registration	✓ Registered antimicrobial active	Varies — some products' marketing claims exceed their registered scope	N/A
EPA Treated Article framework compliance	✓ Compliant claim language framework provided to retail buyers	Varies — many marketing materials in this category exceed PR Notice 2000-1 scope	N/A — no claims made
California EPA approval	✓ Approved (Q1 2026)	Varies — most lack California-specific clearance	N/A
OEKO-TEX® Standard 100 Class I	✓ Certified — safe for direct skin contact, including infant skin	Class I rare; most certify only Class II or higher	Varies (untreated textiles often Class II)
bluesign® approved	✓ Approved — sustainable textile chemistry	Rare — most silver chemistries flagged for aquatic toxicity concerns	Untreated fabrics may qualify on substrate alone
PFAS-free verified	✓ Verified — passes CA SB 707 + EU REACH	Varies — antimicrobial chemistry typically PFAS-free, but co-applied finishes may contain PFAS	Varies
Wash durability (documented)	100 industrial washes — third-party AATCC 100-2012 reports available (ISO/IEC 17025 lab accreditation)	Typically 30 washes manufacturer-claimed — third-party reports rarely publicly available	N/A
Wash-water leaching	Non-leaching by design — nothing released into wash water	Silver release into wastewater documented per lifetime of garment	N/A
Anti-mildew (product preservation)	✓ Inhibits growth of mildew that causes product deterioration (AATCC 30 third-party report on request)	Limited — most silver-only formulations have weaker antifungal activity	N/A
Anti-odor (freshness)	✓ Inhibits growth of odor-causing bacteria (ISO 20743 third-party report on request)	Some products tested — most don't disclose results in technical documentation	N/A
Hard-surface technical validation	✓ Independent lab data on ceramic, porcelain, stainless, formica, plastic ABS, marble surfaces (24-hour test, single application)	Most products textile-only — limited validation on hard surfaces	N/A

Feature	Nomad Home + FUZE	Standard Silver-Treated	Standard Untreated
Application dose verification	✓ ICP-confirmed on every production batch — dose documented per lot	Manufacturer-claimed dose — no batch-by-batch verification disclosed	N/A
Heavy-metal release in landfill / wash water	None — bonded chemistry, no leach	Silver leached into wastewater treatment + landfill — aquatic toxicity concerns documented	N/A
Third-party laboratory documentation	✓ Reports from accredited labs (AATCC 100, ASTM E2149, AATCC 30, ISO 20743) available to retail buyer compliance teams on request	Manufacturer-published claims — third-party validation rarely disclosed	N/A

How to Read This Table

Nomad Home + FUZE (emerald column) represents the product line featuring FUZE® antimicrobial protection. Every row marked ✓ is supported by either third-party laboratory documentation, federal regulatory registration, or independent certification body assessment. Documentation is available on request through Nomad Home's manufacturing partner.

Standard Silver-Treated (amber column) represents the category of textile and hard-surface antimicrobials based on first-generation silver chemistries — silver chloride dispersions, silver ion delivery systems, and silver-zeolite carriers — that dominate the existing antimicrobial home-goods market. Specific competitors vary in registration scope, durability validation, and certification coverage. The column reflects the typical category-average profile.

Standard Untreated (neutral column) represents conventional home and bath goods without any antimicrobial treatment.

Featuring FUZE® antimicrobial protection across every product. Manufactured by JLA. Verified by ICP testing on every production batch. Documentation and third-party laboratory reports available through your Nomad Home buyer contact.

Test methods referenced

AATCC 100 — Quantitative antibacterial textile efficacy assessment. ASTM E2149 — Dynamic-contact antimicrobial assessment for non-leaching surfaces. AATCC 30 — Antifungal textile assessment (*Aspergillus brasiliensis*). ISO 20743 — Quantitative antibacterial activity of textile products. ISO 18184 — Antiviral activity of textile products against influenza viruses. All cited results derive from accredited third-party laboratory reports. Documentation available through the Nomad Home buyer contact.
