

Nomad Home

Hospitality-Inspired Comfort · Antimicrobial Verified Protection

Every product in the Nomad Home line — bedding, sheets, bath textiles, robes, accessories, pet, and room essentials — is antimicrobial-treated with FUZE® for lasting freshness. Inhibits the growth of odor-causing bacteria and mildew that causes product deterioration. Independently lab-validated. Application dose verified by ICP testing on every batch.

100

washes of documented antimicrobial durability — third-party lab verified (AATCC 100, ISO/IEC 17025)

5

independent certifications: OEKO-TEX Class I, bluesign, EPA, California EPA, PFAS-free

0

PFAS — no forever chemicals, no heavy-metal leaching, no ion off-gassing

How FUZE Protects Every Surface

BONDED, NOT SPRAYED	CONTACT-KILL ACTIVE	NON-LEACHING BY DESIGN
FUZE metamaterial is bonded permanently into the fiber or surface during manufacture. It does not wash off, wear off, or transfer to skin or air. Protection lasts the product lifetime.	Bacteria and fungi are neutralized on contact with the treated surface. No ions released into the air. No mist, no off-gassing, no consumable refills.	Unlike ion-releasing antimicrobials, FUZE does not leach into wash water or ambient air. Cleaner for end users. Cleaner for waterways.

Independently Certified

OEKO-TEX® Standard 100 Class I	bluesign® Approved	EPA Federal Registered	California EPA Approved (Q1 2026)	PFAS-Free Verified
Safe for direct skin contact, including infant skin	Sustainable textile chemistry & responsible production	Registered antimicrobial under federal pesticide law	Cleared for California's strictest chemical safety regime	No forever chemicals — passes CA SB 707 textile rules

Across the Nomad Home Line

Every category. Every surface. Verified antimicrobial protection.

BASIC BEDDING	SHEETS	DECORATIVE BEDDING	BATH ACCESSORIES
Quilts and comforters antimicrobial-treated to inhibit growth of odor-causing bacteria. Long-lasting freshness; documented 100-wash durability.	OEKO-TEX® Class I certified — safe for direct skin contact, including infant skin. Antimicrobial-treated for freshness between launderings.	Throws, pillow shams, and runners antimicrobial-treated for freshness. FUZE bonds permanently — no transfer, no off-gassing, no consumable refills.	Soap pumps, tissue dispensers, and amenity trays treated to inhibit growth of mildew that causes product deterioration. Surface stays cleaner between cleanings.
APPAREL & ROBES	BATH TEXTILES	PET	ROOM ACCESSORIES
Robes and apparel treated to inhibit growth of odor-causing bacteria — stays fresher between washes. Lasting freshness, no loss of softness.	Shower curtains, towels, and bath mats treated to inhibit growth of mildew that causes product deterioration. Engineered for the bathroom environment.	Beds, blankets, and mats with the same OEKO-TEX Class I certification approved for infant skin contact. Antimicrobial-treated for freshness.	Waste baskets, ice buckets, amenity trays treated to inhibit growth of mildew that causes product deterioration on high-touch room surfaces.

"Hospitality-inspired antimicrobial technology — now treated into every product across the Nomad Home line for lasting freshness."

Why Retail Buyers Choose Nomad Home + FUZE

Differentiated category leadership	Most antimicrobial home goods rely on first-generation silver chemistries. Nomad Home features the next-generation FUZE metamaterial — bonded, contact-kill, non-leaching, with the broadest regulatory registration footprint in the category.
Trust signals consumers recognize	OEKO-TEX® Class I (safe for infant skin) is the most consumer-trusted textile safety mark globally. Pair it with bluesign®, EPA federal + California EPA, and PFAS-free verification — every certification a retail buyer looks for, on every product.
Verified application — every batch	Independent ICP (Inductively Coupled Plasma) testing on every production batch confirms the antimicrobial dose actually applied to the product. No other antimicrobial home-goods supplier provides this level of batch-by-batch verification.
Vertically integrated supply	JLA manufactures the products and applies the FUZE treatment in-house. No mill-to-treatment-to-distributor chain. Faster lead times, consistent quality, traceable production.
Regulatory headroom	Federal EPA registration covers the full antimicrobial claim scope for treated articles. California EPA approval clears the strictest US state market. PFAS-free verification passes California SB 707 textile chemistry rules and equivalent EU/global regimes.

Nomad Home by JLA · Antimicrobial-treated with FUZE® · Manufactured under verified ICP application standards · Available across all eight Nomad Home product categories

Technical Validation

Independent third-party laboratory data supporting Nomad Home's antimicrobial treatment claims

For retail buyer reference and compliance team review. The data below is the third-party laboratory validation underlying the EPA-compliant claim language Nomad Home uses on its products and product pages. The data is NOT itself a consumer-facing claim. See the Compliant Claim Language Guide below for the consumer-facing language Nomad Home is authorized to use on product listings and packaging.

Wash durability (textile applications)

Test Method	Sample	Result	Lab Accreditation
AATCC 100-2012 (Antibacterial Finishes on Textile Materials)	Pima cotton, antimicrobial-treated, 100 industrial wash cycles per AATCC Monograph M6	99.991% bacterial reduction after 100 washes vs. control	L-A-B Accredited ISO/IEC 17025 Certificate # L223B
Industry-standard wash protocol	100 home-laundry cycles, Top Loader, Normal Warm, 1.8kg load, AATCC reference detergent	Treatment performance maintained through documented wash count	Third-party accredited

Hard-surface validation (room accessories applications)

Surface Type	24-Hour Test Result	Test Conditions
Ceramic tile	96% reduction vs. untreated control	Single one-second application, 24-hour test
Porcelain	95% reduction vs. untreated control	Single one-second application, 24-hour test
Stainless surface	94% reduction vs. untreated control	Single one-second application, 24-hour test
Formica	91% reduction vs. untreated control	Single one-second application, 24-hour test
Plastic ABS (dispensers, accessories)	87% reduction vs. untreated control	Single one-second application, 24-hour test
Marble	81% reduction vs. untreated control	Single one-second application, 24-hour test

Compliant Claim Language Guide for Retail Listings

What you CAN say on product listings, packaging, and marketing. Per US EPA PR Notice 2000-1 (Treated Article Exemption framework), Nomad Home products are authorized to make the following antimicrobial claims at retail:

Freshness claims	"Antimicrobial-treated for lasting freshness" · "Stays fresher between washes" · "Freshness protection that lasts the product lifetime"
-------------------------	---

Odor-control claims	"Inhibits the growth of odor-causing bacteria" · "Anti-odor protection" · "Reduces laundry-malodor build-up"
Product preservation claims	"Inhibits the growth of mildew that causes product deterioration" · "Helps preserve the product against mildew growth" · "Antimicrobial-treated to preserve product freshness"
Certification statements	"OEKO-TEX® Standard 100 Class I certified" · "bluesign® approved" · "EPA-registered antimicrobial treatment" · "PFAS-free" · "California EPA-approved" — all factual certification statements
Technology/quality claims	"Antimicrobial-treated with FUZE® technology" · "Application dose verified by ICP testing" · "Independently lab-validated" · "Non-leaching, non-migrating treatment"

What you should NOT say on product listings or packaging without additional product-specific public-health pesticide registration:

Public-health claims	"Kills bacteria" · "Kills 99.9% of germs" · "Antibacterial" · "Bactericidal" · "Germicidal" · "Disinfects" · "Sanitizes"
Specific organism claims	Naming specific pathogens (e.g., MRSA, Staphylococcus aureus, E. coli, Influenza) in promotional context — these convert the claim into a public-health pesticidal claim under FIFRA
Antiviral/disease claims	"Antiviral" · "Kills viruses" · "Protects you from infection" · "Reduces transmission risk" · "Hospital-grade"
Health-protection framing	"Protects your family from disease" · "Reduces risk of illness" · "Medical-grade protection" · "Healthcare-quality antimicrobial"

EPA Treated Article Framework — Regulatory Basis. Per US EPA Pesticide Registration Notice 2000-1, articles treated with an antimicrobial preservative are exempt from product-specific public-health pesticide registration ONLY IF marketing claims are limited to the article's preservation itself (e.g., inhibiting growth of mildew that causes product deterioration) or to odor-causing bacteria. Claims that suggest the treated article protects consumers against pathogenic organisms — "antibacterial," "bactericidal," "germicidal," "kills X% of bacteria" — fall outside the Treated Article Exemption and trigger FIFRA Section 12(a)(1)(E) misbranding liability without appropriate product-specific registration. The underlying FUZE® antimicrobial active carries federal EPA registration; downstream product claims must remain within the registered scope. Nomad Home retail buyer and compliance teams: please ensure listings, packaging, and promotional language stay within the green-column language above.
